

Shallow Dialogue Annotation (SDA) for a Transcript-based Query and Browsing interface (TQB) to meetings

Andrei Popescu-Belis

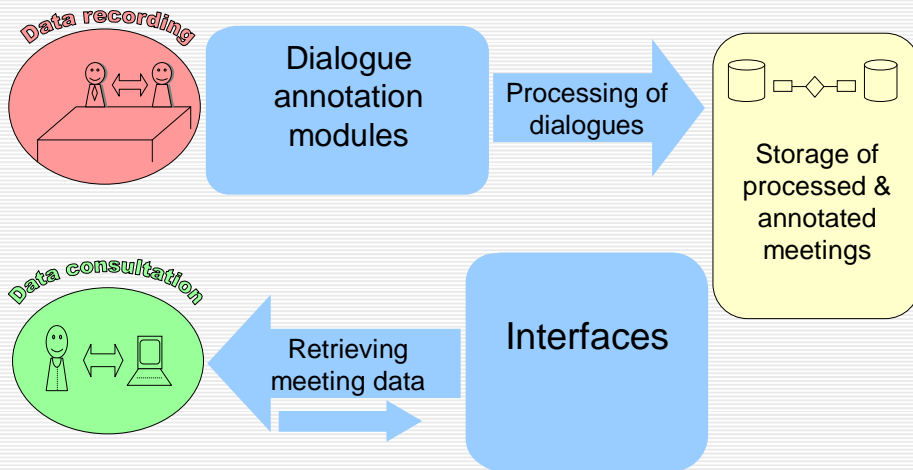

Alexander Clark
Maria Georgescu
Sandrine Zufferey
ISSCO/TIM/ETI
University of Geneva

Denis Lalanne
DIVA/DIUF
University of Fribourg

Research on meeting processing

- Desirable:
 - Fully automated minute writing application.*
- Reasonable hope:
 - “Were there any questions about section 2 of the report?”*
- Range of applications
 - enriched meeting transcription
 - meeting summarization
 - intelligent meeting browsing
 - digital assistants for meeting rooms

Meeting processing & retrieval

26/11/2004

Shallow Dialogue Annotation for TQB

3

Constraints on our study of dialogue processing

- Theoretical grounding
 - availability of models of the phenomenon
 - known active research topics
- Application requirements
 - what users want to retrieve: analysis of user queries
 - relevance to other applications in the field
- Empirical validity
 - definitions based on examples occurring in a given corpus
 - human annotators find consistent results
- Availability of data
- Apparent feasibility

26/11/2004

Shallow Dialogue Annotation for TQB

4

Selected phenomena: **SDA** **Shallow Dialogue Annotation**

- **Input data:** timed transcript of individual channels

	Name	Type of annotation	Scope
EP	episodes (1)	temporal boundaries	cross-channel
TO	topics/keywords	labels on EP (open set)	same as EP
UT	utterances	temporal boundaries	intra-channel
DA	dialogue acts (2)	labels on UT (DA tagset)	same as UT
RE	referring expressions	temporal boundaries	intra-channel
DE	ref. to doc. elements (3)	pointers RE → DE	cross-modal
DM	discourse markers (4)	word classification	intra-channel

26/11/2004

Shallow Dialogue Annotation for TQB

5

1. Thematic episodes (EP)

- Segmentation of meeting into coherent blocks defined by a common topic
- Representation of input
 - based on lexical items
 - vector space model
- Training
 - use of latent semantic analysis (LSA) to reduce dimensionality of word/frequency matrix
 - singular value decomposition
 - deletion of smallest diagonal terms

26/11/2004

Shallow Dialogue Annotation for TQB

6

Application of LSA

- Test phase
 - thematic distance between consecutive utterances
 - computed by projection on the reduced lexical space
 - segmentation at lowest points
- Evaluation
 - various conditions on expected number of boundaries
 - various scoring methods
- Results
 - better to train and test on same type of data
 - e.g., texts from Brown corpus, TDT data
 - 10-20% error rate
 - ICSI-MR data
 - 35% error rate
 - also used: C99

26/11/2004

Shallow Dialogue Annotation for TQB

7

2. DA recognition

- Dialogue act: function of an utterance in dialogue
 - presupposes segmentation of channels into utterances
- Many tag sets available, e.g. ICSI-MRDA (~ 7.10⁶ labels)
- **MALTUS** (~ 500 labels)
 - main function
 - statement, question, backchannel, floor holder/grabber
 - secondary function
 - response (positive, negative or undecided), attention-related, command (performative), politeness mark, restated information
- Dataset
 - conversion of ICSI-MR to MALTUS
 - 50 occurring MALTUS labels in **113,560 utterances**

26/11/2004

Shallow Dialogue Annotation for TQB

8

DA tagging: objectives and features

- Our objectives
 - find dimensions of MALTUS that are most easily predictable from data
 - find hidden dependencies among tags
 - different from tagging using a language model ([Stolcke et al. 2000])
 - features: word n-grams + dialogue model (sequence of DAs)
- Simplifying assumption
 - allow access to the gold standard DA of surrounding utterances
 - use maximum entropy classifier (no decoding)
- Features
 - lexical
 - 1000 most frequent words + their positions in utterance
 - contextual
 - label of the preceding utterance in the same channel & in different channels (x2)
 - label of utterances overlapping with current one & contained in the current one (x2)

26/11/2004

Shallow Dialogue Annotation for TQB

9

DA tagging: results

- Four way classifier (S | Q | B | H)
 - 84.9% accuracy vs. 64.1% baseline
- Six way classifier (S | Q | B | H | disruption | indecipherable)
 - 77.9% accuracy vs. 54.0% baseline
- **Full MALTUS classifier** (but no disruptions)
 - 73.2% accuracy vs. 41.9% baseline (S tag)
- MALTUS with six classifiers trained separately
 - Primary classifier: S | H | Q | B
 - Five secondary classifiers: PO | not PO, AT | not AT, etc.
 - 70.5% accuracy only

26/11/2004

Shallow Dialogue Annotation for TQB

10

3. References to documents (RE→DE)

- Cross-media link between
 - what is said: referring expressions
 - documents and elements referred to

- Pre-requisites
 - detection of referring expressions (RE)
 - ongoing work
 - automatic detection of document elements = document structuring

Ref2doc annotation

```
<dialog>
  <channel id="1" name="Denis">
    ...
    <er id="12">The title</er>suggests that the issue...
  </channel>
  ...
  <ref2doc>
    ...
    <ref er-id="12"
      doc-file="LeMonde030404.Logic.xml"
      doc-id="//Article[@ID='3']/Title"/>
    ...
  </ref2doc>
</dialog>
```

Referring expression (uttered by Denis)

Document referred to (XML logical structure)

Document element (XPath)

Algorithm based on anaphora tracking (hand-crafted)

- Loop through REs in chronological order
 - store <current document> and <current document element>

- Document assignment
 - if RE includes newspaper name
 - refers to that newspaper
 - <current document> set to that newspaper
 - otherwise (anaphor) → refers to <current document>

- Document element assignment
 - if RE is anaphoric
 - refers to <current document element>
 - otherwise
 - best matching document element
 - (words of RE + context) $\leftarrow \{ match \} \rightarrow$ words of document
 - <current document element> set to that element

26/11/2004

Shallow Dialogue Annotation for TQB

13

Results and optimization

- Best results (322 REs)
 - RE → document: **93%** vs. 50% baseline (most frequent)
 - RE → doc. element: **73%** vs. 18% baseline (main article)

- Optimization of features and their relevance
 - **contextual features**
 - only right context of the RE must be considered for matching
 - optimal size of context: ~ 10 words
 - **relevance: when removed, ~ 40% accuracy only**

 - **(local) optimal weights for matching**
 - RE \leftrightarrow title of article ≈ 15
 - right context word \leftrightarrow title ≈ 10
 - * \leftarrow content word of article ≈ 1

 - **anaphora tracking**
 - **relevance: when removed, ~ 65% accuracy only**

26/11/2004

Shallow Dialogue Annotation for TQB

14

4. Discourse markers (DM)

- Useful to detect
 - increase accuracy of POS tagging
 - prelude to syntactic analysis
 - indicate global discourse structure
 - indicate coherence relations (à la RST) between utterances
 - serve as features for the automatic detection of dialog acts

- Two markers were studied [Zufferey & Popescu-Belis 04]
 - “like” - signals approximation
 - “well” - marks topic shift, or correction

- Problem
 - both lexical items are ambiguous: they can function as a discourse marker or as something else (e.g., verb or adverb)
 - need to **disambiguate occurrences: DM vs. non-DM**

26/11/2004

Shallow Dialogue Annotation for TQB

15

Statistical training of DM classifiers

- Decision trees + C4.5 training (Quinlan / WEKA)

- Features characterizing DM vs. non-DM uses
 - “negative” or excluding collocations
 - duration of item
 - duration of pause before *like*
 - duration of pause after *like*

- Set of positive and negative examples from ICSI-MR
 - ~ 4500 for *like* and ~ 4500 for *well*

- Results of the training
 - binary decision tree classifier (DM / non-DM)
 - measure of the discrimination power: 10 times cross-validation

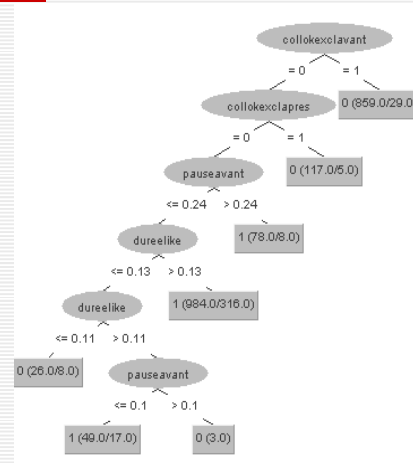

26/11/2004

Shallow Dialogue Annotation for TQB

16

Results for DM classification

- Scores for *like*: best classifier
 $r = 0.95 / p = 0.68 / \kappa = 0.65$
- Conclusions
 1. Importance of collocation filters
 2. A pause before *like* indicates a DM in 91% of the remaining cases
 3. Other factors are relevant too, but quite redundant
 → prosody
- Scores for *well*: best classifier
 $r = 0.97 / p = 0.91 / \kappa = 0.81$

26/11/2004

Shallow Dialogue Annotation for TQB

17

Synthesis: machine learning for SDA

- Use of machine learning when...
 - enough annotated data for training
 - enough low-level relevant features
 - unknown optimal relations between features and annotations
- **DA, EP, (TO), DM**
 - possibility to add some obvious hand-crafted rules
- Use of hand-crafted rules or classifiers when...
 - not enough data to learn relations between features and annotations
- **(UT), (RE), RE→DE**
 - possibility to optimize automatically the hand-crafted rules

26/11/2004

Shallow Dialogue Annotation for TQB

18

Machine learning techniques and their scores

	Tag set	Method	Baseline	Accuracy
DA	MALTUS	MaxEnt	~ 40%	70-73%
EP	Boundaries	LSA/C99	67%	60-(90)%
DE	RE→DE	Rule-based	~ 20%	73%
DM	DM/non-DM	Decision trees, C4.5	36% (<i>like</i>) 66% (<i>well</i>)	81% 91%

- ▶ Machine learning appears to be relevant to both semantic and pragmatic annotations
- ▶ More or less transparent models

26/11/2004

Shallow Dialogue Annotation for TQB

19

Available data

	Nb. x time	Media	Lg.	Annotation
ICSI-MR	75 x 60'	A, T	EN	utterances, dialogue acts, discourse markers, episodes(30%)
IDIAP	60 x 5'	A, V, T	EN	utterances, episodes
ISSCO	8 x 30'	A, V, T, D	EN	ongoing: all
UniFr	22 x 15'	A, V, T, D	FR	utterances, references to documents

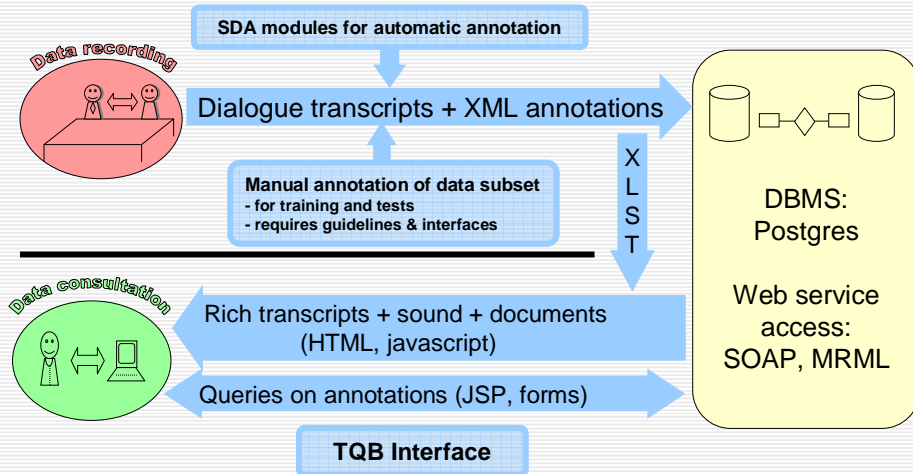

- Difficulty
 - no large dataset available yet with **all** SDA annotations

26/11/2004

TQB: Transcript-based query & browsing interface

The screenshot shows the TQB interface with several callouts highlighting key features:

- 1. Parameters of the query:** The search criteria section on the left, including fields for 'Choose a dialogue', 'Speaker', 'Dialog act', and 'Word'.
- 2. Results of the query:** The list of search results in the center, showing transcript snippets with time stamps and speaker names.
- 3. Rich transcript:** A callout pointing to a specific transcript entry in the list.
- 4. Links to sound file:** A callout pointing to a 'play' button next to a transcript entry.
- 5. Documents:** A callout pointing to a list of document references on the right side of the interface.
- 6. References to documents:** A callout pointing to a specific document reference in the list.

26/11/2004

Shallow Dialogue Annotation for TQB

22

Future work

- Integration of SDA modules
 - each module generates annotations based on features and other existing annotations
 - trigger modules in a loop until no annotation can be added
- Extensions
 - improve/extend existing modules: TO, RE, ...
 - add new annotation modules: **depending on user needs**
 - make use of new features, especially from other modalities: prosody, face expression, ...
